

	Answer	Notes	Marks
6 (a)	<p>any four from:</p> <p>MP1. water near heater is heated; MP2. (heated) water expands;</p> <p>MP3. density of (heated) water decreases; MP4. lower density / warm water rises; MP5. cooler / denser water sinks; MP6. process repeats / is continuous;</p>	<p>allow clear annotations on diagram</p> <p>accept 'particles move apart from each other' / 'particles spread out'</p> <p>reject particles expand</p>	4
(b) (i)	<p>temperature increases with time; idea that rate of temperature increase reduces;</p>	<p>allow 'temperature increases at a decreasing rate' / EQ for 2 marks</p>	2
(ii)	<p>temperature rise is quicker when container is empty;</p> <p>with any two explanations from:</p> <ul style="list-style-type: none"> • particles move around quicker/have more KE in gases; • convection current is faster in gases; • energy transfer (by convection) is quicker; • mass of air in empty container less than mass of water in full container; • specific heat capacity of air is lower than water; 	<p>allow empty container reaches higher temperature</p> <p>ignore comments about conduction</p> <p>allow particles in gases are more free to move</p> <p>allow less particles in empty container</p> <p>allow RA</p>	3

Total for Question 6 = 9 marks
