- (a) Solar panels provide direct current to a device that outputs an alternating current so that the energy from the solar panels can be supplied to the National Grid.

- (i) Explain why a step-up transformer is used to supply the National Grid.

(ii) This is the label on the step-up transformer.

input voltage = 15 kV

output voltage = 340 kV

number of turns on primary coil = 1400

State the formula linking input voltage, output voltage and turns ratio for a transformer.

(1)

(iii) Calculate the number of turns on the secondary coil of the step-up transformer.

(3)

number of turns = .....

(b) Solar panels produce constant direct current (d.c.).

Explain why a transformer will not work when connected to constant direct current.

(3)

(Total for Question 6 = 9 marks)
