4.

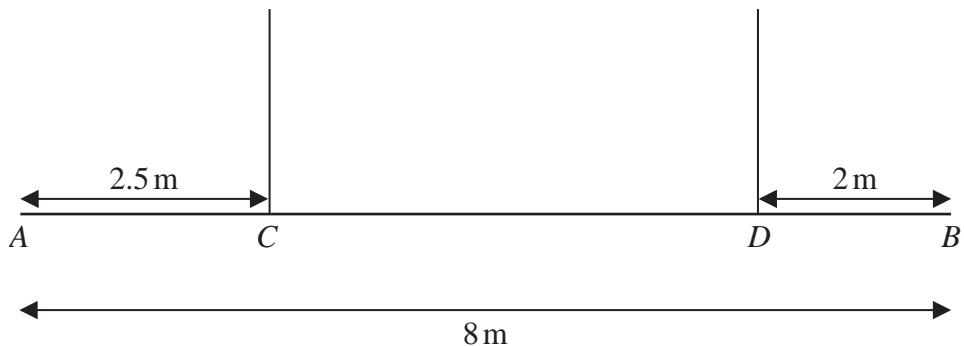

Figure 2

A non-uniform beam AB has length 8 m and mass M kg.

The centre of mass of the beam is d metres from A .

The beam is supported in equilibrium in a horizontal position by two vertical light ropes. One rope is attached to the beam at C , where $AC = 2.5\text{ m}$ and the other rope is attached to the beam at D , where $DB = 2\text{ m}$, as shown in Figure 2.

A gymnast, of mass 64 kg, stands on the beam at the point X , where $AX = 1.875$ m, and the beam remains in equilibrium in a horizontal position but is now on the point of tilting about C .

The gymnast then dismounts from the beam.

A second gymnast, of mass 48kg, now stands on the beam at the point Y , where $YB = 0.5\text{ m}$, and the beam remains in equilibrium in a horizontal position but is now on the point of tilting about D .

The beam is modelled as a non-uniform rod and the gymnasts are modelled as particles.

Find the value of M .
