5. [In this question  $\mathbf{i}$  and  $\mathbf{j}$  are perpendicular horizontal unit vectors.]

A particle  $P$  is moving with constant acceleration. At 2pm, the velocity of  $P$  is  $(3\mathbf{i} + 5\mathbf{j}) \text{ km h}^{-1}$  and at 2.30pm the velocity of  $P$  is  $(\mathbf{i} + 7\mathbf{j}) \text{ km h}^{-1}$

At time  $T$  hours after 2pm,  $P$  is moving in the direction of the vector  $(-\mathbf{i} + 2\mathbf{j})$

- (a) Find the value of  $T$ .

(6)

Another particle,  $Q$ , has velocity  $v_Q$  km h<sup>-1</sup> at time  $t$  hours after 2 pm, where

$$\mathbf{v}_o = (-4 - 2t)\mathbf{i} + (\mu + 3t)\mathbf{j}$$

and  $\mu$  is a constant.

Given that there is an instant when the velocity of  $P$  is equal to the velocity of  $Q$ ,

- (b) find the value of  $\mu$ .
